Amendments to the Specification:

Please amend the paragraph beginning on page 17, line 17 as follows:

Next, labeled changes to any of the rows of the plurality of table copies are asynchronously captured, via step 702. The labeled changes at each database are captured by the capture program by accessing entries of the database recovery log. The type of change is for each captured entry is then determined. The possible types include row 'insert', 'delete', 'non-key update', and 'key update'. The old and new column values of the changed rows are then ~~extracting~~ extracted from the recovery log entries, including the old and new label column values. The extracted values further ~~includes~~ include changed and unchanged key column values.
